

Phone Front

Phone back

(product placement)

← extra microphones in case might be necessary

← uses existing microphone

(would be another add-on but shouldn't be too expensive)

## Customizable app interface:

view location when sound was received on a map  
← sounds can be associated with colors

↑ "alert" is speaker sound for audio interface and vibration (intensity + pattern) for tactile interface.  
click the sound waves to hear feedback

Click boxes also let the user customize with more granularity what sounds they want at a given time

Shows the sound, if the user does happen to be looking at their phone (doubtly distracted)

\* Cons with Custom Sound - alert defaults and preset defaults

↑ "presets" are grasshoppers. Luckily the user can select what preset they want at a given time, or the ten (eg. Preset 1 from 9am to 6pm and Preset 2 from 6pm to 9am).
